

Unit 5 Quadratic Functions
Day 4 Multiplying and Factoring Activity (PH 9-3 and 9-4)

Name: _____
Date: _____ **Hour:** _____

Example 1: To multiply two binomials, an area model can be used.

$(x + 3)(2x + 8)$ can be represented:

Step 1:

Step 2:

Step 3:

Step 4:

Thus, the product is $2x^2 + 8x + 6x + 24$ and can be rewritten in standard form $2x^2 + 14x + 24$.

Use an area model to multiply the following binomials:

1. $(3x + 4)(x + 2)$

Standard Form: _____

2. $(2x - 3)(3x + 6)$

Standard Form: _____

3. $(5x - 3)(4x + 2)$

Standard Form: _____

4. $(5x - 4)(6x - 1)$

Standard Form: _____

5. $(3x - 2)(3x + 2)$

6. $(5x - 4)^2$

Standard Form: _____

Standard Form: _____

Now, if we have the solution, can we find the factors? Try finding the two binomial factors that would produce these solutions:

9.

x^2	$-6x$
$-8x$	48

two factors

10.

$3x^2$	$+4x$
$+6x$	$+8$

two factors

11.

$5x^2$	$-7x$
$+15x$	-21

two factors

12.

$6x^2$	$+8x$
$-21x$	-28

two factors

Find the two binomial factors that produce each product.

13. $x^2 + 10x + 21$

two factors

14. $3x^2 + 14x + 8$

two factors
